

National Cybersecurity Law

Comprehensive framework for digital sovereignty — harmonising citizen rights, corporate duties, and national defence to protect the digital economy.

Presented by: Tabrez Ahmed (24102B0041) ▪ Abdur Rahman (24108B0033)

Introduction

The Law establishes a national cybersecurity framework to protect digital infrastructure and personal data, deter cybercrime, and enable resilient response and recovery — supporting a secure, trusted digital economy.

Protect Infrastructure

Standards for resilience of critical services and networks.

Protect Citizen Data

Legal safeguards for privacy, consent, and breach notification.

Strengthen Response

Clear investigative powers, penalties, and recovery pathways.

Objectives of the Law

- Protect citizens and their personal data from unlawful access and misuse.
- Secure critical infrastructure and digital services against disruption.
- Ensure corporate accountability for security and breach transparency.
- Promote digital trust through privacy safeguards and clear governance.
- Strengthen national cyber defence and international cooperation.

Key Definitions

Malware / Ransomware

Malicious software used to disrupt systems, encrypt data, or exfiltrate information.

Phishing

Deceptive communications aimed at stealing credentials or delivering malware.

Data Breach

Unauthorized disclosure, access, or loss of protected information.

Digital Signature & Encryption

Mechanisms to verify authenticity and protect confidentiality of data.

Cloud & AI

Modern service models and technologies subject to security and governance rules.

Citizens' Digital Rights

- Right to privacy and data protection
- Right to secure and accurate personal data
- Right to request deletion and portability
- Right to clear information about data use
- Right to report cybercrime and expect fair investigation

Legal remedies and timelines are specified for enforcement, including expedited breach notifications, appeals pathways, and penalties for unlawful processing. Rights are paired with obligations for data controllers to demonstrate compliance.

Cyber Offences and Penalties

1

Unauthorized Access

Illicit entry to systems — penalty up to 2 years imprisonment and fines.

2

Data Theft & Identity Theft

Exfiltration and impersonation — 3–5 years imprisonment depending on severity.

3

Phishing & Fraud

Credential theft and financial fraud — penalties include imprisonment and restitution.

4

Ransomware Attacks

Mass disruption and extortion — up to 10 years imprisonment and substantial financial penalties.

Sanctions scale with intent, impact, and recurrence. Corporate liability provisions impose fines and remediation duties in addition to criminal sanctions for individuals.

Data Protection Framework

Core requirements to govern collection, retention, storage and lawful processing of personal and sensitive data.

- Data minimisation and purpose limitation
- Secure storage and encryption-at-rest/in-transit
- Data localisation for designated sectors
- Informed user consent and revocation rights
- Retention schedules and lawful disposal
- Mandatory breach notification timelines

Corporate Responsibilities

Encryption & Access Controls

Enforce strong cryptography and least-privilege access by default.

Designated CISO

Appoint a senior security officer with regulatory reporting duties.

Testing & Training

Annual penetration tests, continuous patching, and staff security training.

Authentication Standards

Enforce multi-factor authentication and session protections across critical systems.

Incident Reporting & Government Roles

Structured reporting and coordinated response are central to national resilience.

1. Detection & containment
2. Internal investigation and evidence preservation
3. Report to National Cyber Security Authority (NCSA)
4. Risk assessment & public advisory
5. Threat mitigation and system recovery
6. Final reporting and regulatory follow-up

The NCSA centralises enforcement, coordinates international cooperation, and runs public awareness campaigns and technical assistance to operators of critical infrastructure.

Future Recommendations & Conclusion

AI & Emerging Tech Governance

Mandatory AI security audits, deepfake regulation, and IoT baseline standards.

Cryptography Roadmap

Plan for post-quantum cryptography and phased migration of critical keys.

Workforce & Education

Scale national training: school-to-university pathways and industry upskilling.

Resilience & National Guard

Establish a cyber national guard for surge response and public-private drills.

Conclusion: Implementing this law will raise national cyber resilience, protect citizen rights, improve corporate accountability, and preserve economic and national security in the digital era.

Thank You

For your attention and engagement. We welcome your questions.
